Introduction

This document will lay out the objectives the Security Team as fixed themselves for this project and the responsibilities of their team members.

Content

Gereral Objectives

The Security Team has, as the name imply, the responsability to insure the Security related problematics of this project. This include making sure the service and/or product we will provide is secured but also implies the monitoring of a secured developpement environnement and severals others problematics that are enumerated and summarized in this document.

One basic way of keeping track of what we need to secure is to isolate each problematics, determine how they impact the 3 main pillars of security **(disponibility, integrity, confidentiality)** and write a document on how to keep the security

problematic under control or to prevent it.

This process can also be completed with the additions of screenshots, scripts, links and others ressources that might help increase the security or show the proof of concept of our security solution.

Admin Rights

The Security Team considers they should have admin rights on monitoring systems, versionning systems and others importants systems, to be able to correctly look up logs and be able to detect and deal with anomalies with ease.

Sensibilizing Others Teams Members

The Security Teams has the responsability of sensibilizing the others team members on the importance of Security.

Legal Monitoring

The Security Team has the responsability to conduct legal monitoring to insure the legality of the project and prevent the project to run into a legal dead end by ignorance.

Required budget and Open Sources softwares

Whenever possible, the Security Team will try to suggest or impose solutions that are both effectives and price effective.
Fortunatly, a number of the tools used worldwide to create security on unix systems are free to use or open sources. This is especially the case with auditing tools and basic robusts securing tools.

The Security Team will consider that a day worth of man hour is priced at 800 €, considering we are not yet BAC+5 personnel and only BAC +3/qualified technicians level, and that all memebers of this project are interns.

Security Documentation Approval Procedure

Each document produced by the Security Team needs to be approved by Marc Martinez, of the Security Team.
Each additionnal version of a document produced by the Security Team needs to approved by Marc Martinez, of the Security Team.
